Qayaq – Kayak

From the Arctic Ocean to Prince William Sound, Alaska’s Native people crafted swift, seaworthy boats from wood and animal skins. Each culture had a distinct style of qayaq with unique qualities. Alutiq qayat were long and slender, built for flexibility in the rough, windy waters of the Pacific Ocean.

The qayaq was also a symbol of manhood. Carefully crafted, well-maintained boats allowed men to harvest fish and sea mammals from the ocean, to travel and trade over great distances, and to carry supplies home. In coastal Alaska, every man was a qayaq builder and paddler. No man could be a successful provider without his own skin boat. Qayat were a lifeline.

**Alutiq Qayaq Types**

- *Qayangqaq* (little kayak) - Single-hatched: For fishing, traveling, and hunting fast animals like porpoise.
- *Qayarpak* (big kayak) - Double-hatched: For team hunting, particularly sea otters. The man in the front hatch hurled weapons while the man in the rear steadied and steered the boat.
- *Paitalek* - Triple-hatched: Made in the Russian era. A large hatch in the center held a Russian trader, smaller hatches in the bow and stern provided seats for Native paddlers. These larger boats carried quantities of gear and supplies.

**Built for Flexibility**

Made from natural materials—pegged, lashed, and sewn together, Alutiq qayat were light, bendable, and stable. Flexibility kept them from breaking in rough seas or when landing.

It took months to collect the wood for a qayaq frame, and different parts of the skeleton required different types of wood. Craftsmen preferred dense, water resistant spruce for bow, stern, and deck pieces. They chose elastic woods with straight grains, like hemlock and alder, for stringers, ribs, and gunwales.

Alutiq men used strips of hide and baleen to tie their qayat together. They never used nails. Nails can make the frame stiff or rub a dangerous hole in the skin cover.

One of the most distinctive parts of the Alutiq qayaq is its split, upturned prow. The lower curved part is slightly hollowed on the sides, helping the boat cut through the water. The tall upper part provides buoyancy, helping the boat float through waves.

**A Skin of Skins**

A kayak’s cover provided protection for the hunter inside. This thin layer of animal skin kept water out and created a smooth surface that slipped though the water. Women created their covers, a task that required great precision.

Alutiq people used both seal and sea lion skins to cover their boats. A hunter preparing to cover a boat would collect skins and age each one to remove the hair. When it was time to create a boat cover, women soaked the skins in water to moisten them for cutting and sewing. They laid skins over the qayaq frame, positioning them to form a cover. Each skin was marked and then cut to shape. With the cut pieces, sewing could begin. It took at least a week to stitch a qayaq cover. Knowledgeable woman supervised those with less experience, checking their work carefully as poor sewing could cost a hunter his life. When the cover was complete, men pulled it over the frame, sometimes using seaweed to help the cover slide into place.
